AMN DESIGN SYSTEM · ENTERPRISE GOVERNANCE

Partner Handover & Contribution Governance Workflow

Design system handover cycle and contribution governance for partners

This chart explains how external companies receive the approved design system, how they use it and propose improvements or additions, and how AMN reviews, approves, merges and publishes them so that all projects benefit.

A Main Flowchart | B Swimlane | C Examples | D Glossary

Guide: Governance Workflow | **Version: TBD** | **Last updated: November 2, 2026**

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

Governance Principles

Eight core principles that govern every step of the workflow

01 Single Source of Truth

There is one official central source for the design system; any copy outside it is not approved.

02 Reuse First

Use what exists before creating something new, and submit an improvement request instead of inventing your own alternative.

03 Controlled Contributions

Improvements and additions are allowed, provided they are reviewed and agreed before any publication.

04 Central Approval

Final approval is the responsibility of AMN (AMN Design System Owner), not the company.

05 Design & Code Alignment

Any impactful change must be updated in the design (Figma) and the SCSS/CSS files together.

06 Shared Improvements

Any approved improvement is available to all companies and projects, not to a single project only.

07 Version Control

Official updates are published in clear versions accompanied by Release Notes.

08 No Unauthorized Changes

Modifying the shared standards outside the approved governance mechanism is prohibited.

Legend Start / End · Stage · Decision · Approved path · Revision loop · Rejection

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

A Main Governance Flowchart

Main chart of the governance cycle — from receiving the system to publishing the approved release

START

A new company starts working within AMN

01 Partner Onboarding & Handover

Receiving the design system

The design system team hands the company the official approved version and specifies the version number and the compliance rules. The company confirms receipt and takes responsibility for working only with the approved version.

- Owner: External Development Company
- Owner: AMN Design System Owner

Approved Release Version | Usage Guidelines | UI Patterns & Templates | Documentation | Design Tokens | SCSS/CSS | Components | Figma Design Libraries

Read-only deliverable: SCSS/CSS

SCSS/CSS files are delivered for use only; the company is not allowed to modify them. If the company needs a change or addition, it creates it in its own separate file outside these files, it is reviewed with us, and we then add it to the approved files.

02 Design System Adoption

Starting to use the system

The company designs and develops the project using the existing components and classes, keeps the approved Structure and Behavior, and uses the available Variants and Tokens instead of creating alternatives.

Owner: **External Development Company**

Keep Structure & Behavior | Use Design Tokens | Use existing Variants | Use Components as-is

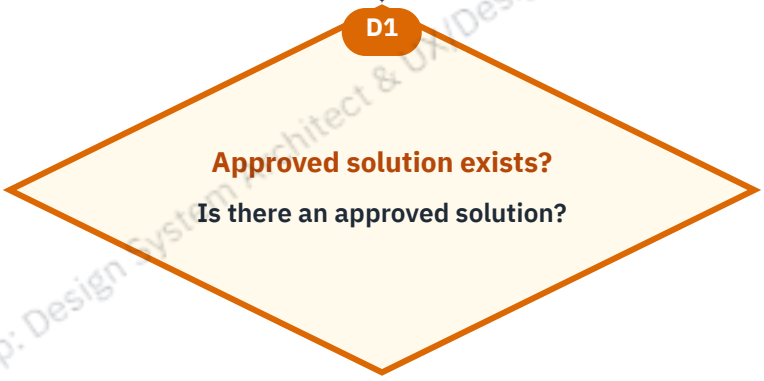

03 Component & CSS Reuse Check

Searching for what exists

Before creating a new Component or CSS Class, the company searches the library and documentation for an approved solution that covers the need.

Owner: **External Development Company**

Search SCSS/CSS Classes | Search Documentation | Search Figma Library

Yes

End · Reuse — use the approved solution

Needs enhancement

Go to stage 04

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

No

Go to stage 04

04 Contribution Request

Addition or improvement request

The company submits a request that explains the need, the proposed solution, and why the existing one is not enough.

- Owner: External Development Company

Fix existing Behavior | Accessibility improvement | New Component | New reusable CSS Class | Improve CSS/SCSS Class | Add new Variant | Update Component design in Figma | Enhance existing Component

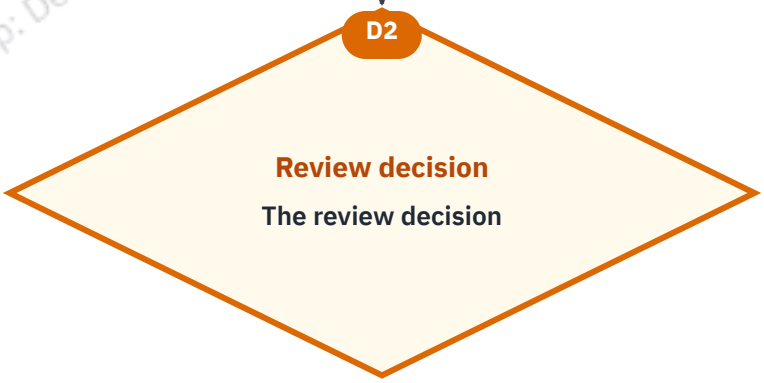

05 Design System Review

Reviewing the request

The design system owner at AMN reviews the request and makes the decision. Approval to start development does not mean final approval for publication.

- Owner: AMN Design System Owner

Check impact on shared system | Check reuse alternatives | Check the need

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

① Use existing

The company uses the existing solution, or amends the request and submits it again.

② Approve to develop

Initial approval — go to stage 06

③ Request changes

Revision loop — back to stage 04

④ Reject

End · Rejected — reason explained

06 Development & Submission

Development and submission

After initial approval, the company develops the solution and submits it for review, using the existing Tokens and Classes as much as possible.

Owner: External Development Company

Usage Examples | Behavior Description | Variants | Component States | SCSS/CSS | Figma Design

07 QA & Final Approval

Quality check and approval

The AMN team checks the change against all criteria. Any remarks return to the company, and if the change meets the conditions it receives Final Approval.

Owner: AMN Design System Owner

Compatibility with Existing Projects | Accessibility | Design Tokens | Code Quality | Component Behavior | Component Structure | Design Consistency

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

D3

All criteria met?

Have all criteria been met?

Yes

Final approval

No

Remarks return to the company — back to stage 06

FINAL APPROVAL

Final approval by AMN

08 Central Integration & Publication

Merge and publish

After approval the change is merged into the central library, everything related to it is updated, then a new official release is published, available to all companies.

- Owner: **Central Design System Library**
- Owner: **AMN Design System Owner**

Available to all partners · Publish official version · Add Release Notes entry · Update Documentation · Update SCSS / CSS · Update Figma (if design-related) · Merge into Central Library

END

Projects move to the new version according to their plan — not necessarily automatically

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

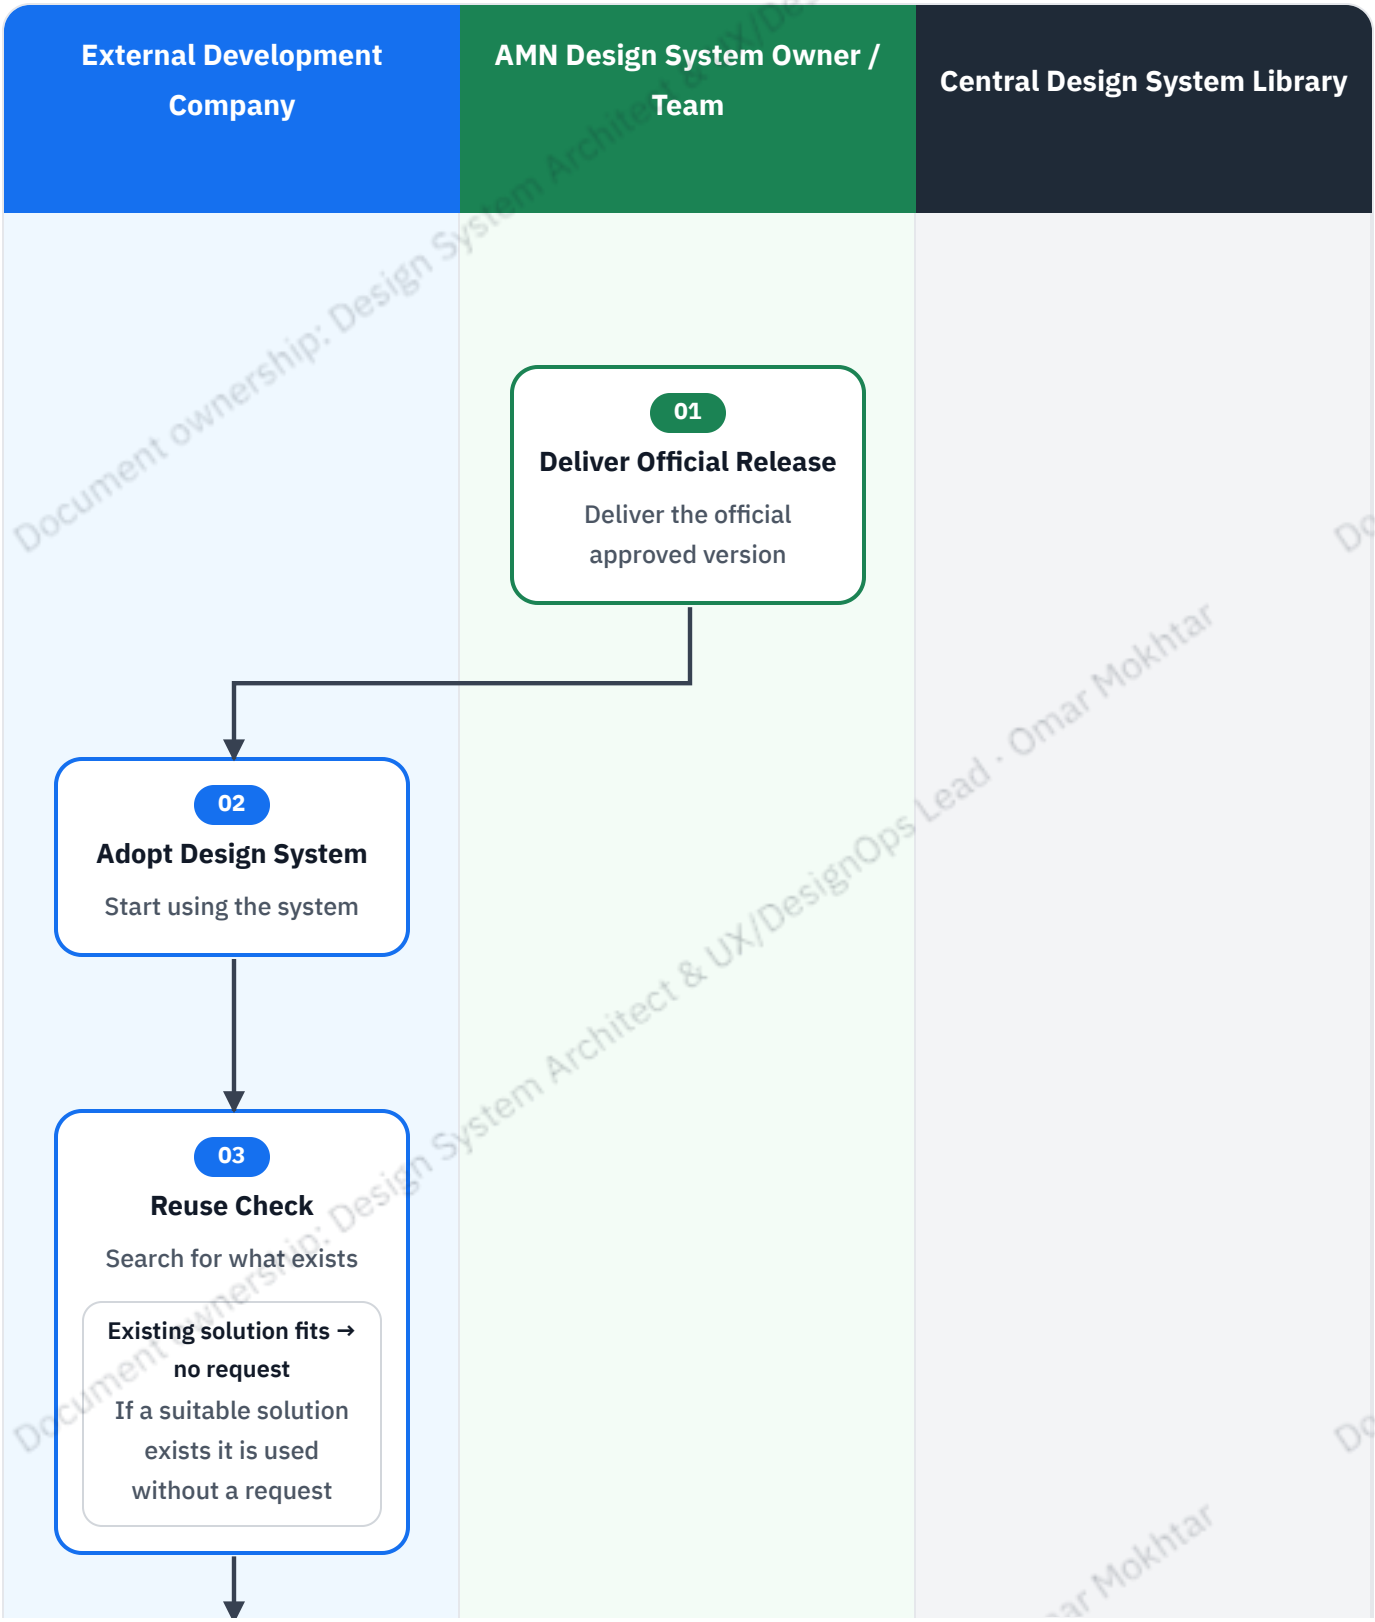

After approval the update is published as a new official release; each project decides when to move to it.

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

C Practical Examples

Practical examples showing how different cases move through the governance cycle

1 Reuse

Use an existing Button

Use an existing button

The company needs a primary action button on one of the screens. It finds the approved Buttons component with its variants in the central library and uses it as is, without drawing a new button or writing a special style.

Case path in the workflow

03 Reuse Check → D1 · Yes → END · Reuse

Result

No request is needed; delivery continues using the approved component.

2 Enhancement

Hypothetical scenario for illustration

Enhance an existing Table

Improve an existing table

The company needs extra behavior that the approved moi-table component does not cover (such as a new option for row actions). Instead of building a replacement table, it submits an improvement request on the same component explaining the need and why the existing one is not enough.

Case path in the workflow

03 Reuse Check → D1 · Enhance → 04 Request → 05 Review → 06 Develop → 07 QA → 08 Publish

Result

The central component improves, and all projects benefit after the new release is approved.

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

3 Code

Hypothetical scenario for illustration

Extend an SCSS class

Extend an SCSS class

The company needs a neutral informational style for helper text under fields. It proposes a new modifier for the existing helper-row class (like the existing modifiers such as is-warning) built on the available Design Tokens instead of writing colors directly.

Case path in the workflow

D1 · Enhance → 04 Request → 05 Review → 06 Develop → 07 QA → 08 Publish

Result

The class is merged into the central SCSS and documented, and becomes available to all companies.

4 New Variant

Hypothetical scenario for illustration

Add a new Variant

Add a new variant

The company wants a new display state for the Tag component, which already has a Status property with several values. It requests a new Variant that follows the same property structure (Size / Variant) instead of drawing a standalone tag outside the library.

Case path in the workflow

D1 · Enhance → 04 Request → 05 Review → 06 Develop → 07 QA → 08 Publish

Result

The variant is added to the central component in Figma and documented, and becomes available when the new release is published.

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

5 Figma Design

Hypothetical scenario for illustration

Update a component design in Figma

Update a component design in Figma

The company proposes improving the visual look of a specific state in the moi-uploader component. It submits the design in Figma including the States and the behavior description, with the matching SCSS/CSS if the code is affected.

Case path in the workflow

04 Request → 05 Review → 06 Develop → 07 QA → 08 Update Figma & Docs

Result

The main component in the central library is updated, and linked copies update after the library is published.

Note

The examples above are illustrative to simplify the idea; the component and class names mentioned are taken from the current system. Any real request goes through the same stages and is assessed by its actual need; none of these scenarios counts as pre-approval.

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

D

Glossary of Terms

Glossary of the terms used in the charts, with simplified definitions for design, development and management teams

Design System
An approved set of components, rules and assets that unify the look and behavior of products.
The central AMN system on which all projects and companies rely.
Figma + SCSS/CSS + documentation.
Governance
The framework of rules and roles that defines how decisions are made and changes approved.
The central review and approval mechanism for any change to the shared system.
An improvement request is not published before it is reviewed.
Workflow
An organized sequence of steps and decision points from start to end.
The path for delivering the system and proposing, approving and publishing improvements.
The main chart (A).
Handover
Transferring the official version of the system to a party that will use it, with its usage rules.
Delivering the approved resources to the company when it starts working within AMN.
Delivering Figma libraries, SCSS/CSS files and documentation.

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

Onboarding

Steps to introduce a new party to the system, its tools and rules.

Welcoming the new company and introducing it to the approved version and its responsibilities.

—

External Development Company

An external party that carries out projects within AMN.

The party that uses the system and submits improvement and addition requests.

A company developing a new module on the platform.

AMN Design System Owner

The party responsible for reviewing and approving system changes.

The team authorized to make the final decision at AMN.

Initial approval and final approval.

Central Library

The single official source of approved components, styles and code.

Gathers the approved Figma, SCSS/CSS and documentation versions.

The central Figma library.

Single Source of Truth

A principle requiring a single official source for information.

Any copy outside the central library is not considered approved.

—

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

Component
A reusable interface element with a defined structure and behavior.
The basic building unit of the system.
Buttons, moi-table, moi-uploader.
Variant
An approved form of a component that differs in size, state or type.
The existing ones are used instead of drawing alternatives.
Status values in the Tag component.
Design Tokens
Named design values (colors, spacing, fonts) used instead of direct values.
They ensure visual consistency between Figma and the code.
$Primary-600
CSS / SCSS Class
A reusable styling class in interface code.
The code counterpart of the approved design.
helper-row with the is-warning modifier.
UI Patterns & Templates
Ready-made patterns and templates for recurring screens or parts of the interface.
They speed up design and keep projects consistent.

—

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

Usage Guidelines

Guidance explaining when and how each element is used.

Part of the approved delivery package for the company.

—

Reuse Check

Checking what exists before creating any new element.

A required step before any addition request.

Searching the Figma library and the documentation.

Decision Point

A point in the chart where the path branches according to a specific answer.

Appears as a diamond (D1, D2, D3) in the main chart.

Is there an approved solution?

Contribution Request

A request the company submits to improve or add to the system.

Explains the need, the proposed solution and why the existing one is not enough.

A request to add a new Variant.

Design System Review

Examining the request and deciding on it by the system owner.

Its decisions: use the existing, initial approval, request changes, or reject.

—

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

Initial Approval

An approval that allows starting development only.

It does not mean final approval or publication.

—

QA

Quality check against defined criteria before approval.

Covers consistency, structure, behavior, code, Tokens and accessibility.

—

Revision Loop

Work returning to the developing party to complete the remarks.

Occurs when changes are requested or the check criteria are not met.

Returning from QA to development.

Final Approval

The final decision to accept the change and merge it into the system.

The responsibility of AMN alone.

—

Accessibility

Designing interfaces so that all users can use them.

One of the check criteria before final approval.

—

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar

Release Notes
A brief log of the changes in each release.
Updated when any approved addition is published.
—
Official Release
An official approved release of the system with a clear number.
Projects adopt it according to their plan; they do not update automatically.
—
Swimlane Diagram
A chart that distributes the steps over lanes according to the responsible party.
Chart B in this document.
—
Integration & Publication
Merging the approved change into the central library and then publishing it.
Stage 08 in the main chart.
—

Document ownership: Design System Architect & UX/DesignOps Lead · Omar Mokhtar
